1 Overview

This document specifies the user interface and user experience for the restaurant Cashier application. It is the visual and interaction companion to the architecture & business-logic specification. The goal is a fast, touch-first cashier screen that an operator can use for a full shift with minimal training, wearing a modern, calm dark theme inspired by the **CosyPOS** concept.

1.1 Design philosophy

- **Classic layout, modern skin.** The structure is the proven three-panel POS layout (navigation, menu, check). Operators rely on muscle memory, so element positions must stay stable. The styling is contemporary; the ergonomics are conventional.
- **Touch-first.** Large tap targets, minimal typing, no hover-only actions. Designed for a landscape tablet or terminal.
- **Show only what's relevant now.** Secondary actions (void, comp, manager approval) appear only in context, never as permanent clutter.
- **Calm, color-coded clarity.** A dark surface with pastel accents; each menu category owns one accent color so the eye finds items fast.
- **Confirm only where money or mistakes are at stake.** Adding an item is silent and instant; voids, comps, and payment confirm.

2 Visual Language (CosyPOS direction)

2.1 Mood

Dark, rounded, and quiet. Deep blue-charcoal surfaces, generously rounded cards, soft pastel accents (blue, pink, purple, mint). Nothing harsh or high-contrast except the data the operator needs. The personality lives in the color-coded categories and the smooth, rounded card system — not in decoration.

2.2 Color tokens

Token	Swatch / Hex	Use
bg	 #181B27	App background
panel	 #20242F	Cards, nav, check panel
panel-2	 #262B38	Inputs, selected rows, chips
line	 #2F3545	Borders, dividers
text	 #E8EAF0	Primary text
muted	 #8B91A3	Secondary text, hints
blue	 #7DB7FF	Primary accent, category
pink	 #FF9EC7	Category accent
purple	 #B69BFF	Category accent, comp
mint	 #8FE3C4	Success, sent, paid
amber	 #FFD27D	Held, ticket number
coral	 #FF8F7D	Void, destructive

Category color rule. Every menu category is assigned one accent from the pastel set. That color is reused on the category chip, the card's left stripe, and the price — so a category reads as one visual family. This is the core CosyPOS navigation device.

2.3 Typography

- **Family:** a clean geometric/neo-grotesque sans (e.g. Inter, or the platform system font). One family, multiple weights — no serif.
- **Scale:** screen title 21 px / 700; section + zone names 15 px / 700; body 14–15 px / 500–600; captions and states 11–13 px / 500 in **muted**.
- Numbers (prices, totals) sit at 600–800 weight; the grand total is the single largest number in the check panel.

2.4 Shape, spacing, motion

- **Radius:** cards and panels 18 px; chips/buttons 12–14 px; pills (category chips) fully rounded.
- **Spacing:** 8 px base grid; 14–24 px gaps between regions.
- **Touch targets:** minimum 44 px height; product cards ≥ 104 px tall.
- **Motion:** subtle only — card press scale 0.97, 120 ms; toast slide-up; modal fade. Respect `prefers-reduced-motion`.

3 Layout — The Three Panels

A single landscape screen, three vertical regions:

NAV 72-80px	MENU (center) flexible	CHECK 320-360px
logo orders tables reports settings <i>server</i>	title + search bar zone tabs category chips (color) product card grid	ticket # + status zone + table field order line items (void/comp on select) subtotal / comps total [Send] [Pay]

- **Left — Navigation rail.** App sections as icons (Orders, Tables, Reports, Settings). The logged-in server's avatar sits at the bottom and is the tap target for switching/identifying the server.
- **Center — Menu.** Title and search on top, then the **zone tabs**, then the color-coded **category chips**, then the **product grid**. This is where the majority of taps land, so it gets the most space.
- **Right — Check.** The open check: ticket number, status, the zone/table line, an optional table-number field, the list of order lines with their states, the totals block, and the **Send** / **Pay** actions pinned at the bottom.

4 Screens

4.1 Cashier — Order screen (primary)

The screen above. The cashier identifies the server, selects a zone, optionally enters a table number, taps products into the check, sends to kitchen, applies voids/comps as needed, and takes payment. Detailed flow in §6.

4.2 Zone management (owner/admin)

A simple list with add / edit / reorder / retire. Each zone row exposes: name, display order, **table_mode** (none / free / fixed), active toggle. Fixed mode reveals an editable list of table labels. Retiring sets the zone inactive (it is never hard-deleted).

4.3 Product & category management (owner/admin)

Category list (name + assigned accent color) and product list (name, category, price, active). Color picker limited to the pastel token set so the palette stays coherent.

4.4 Reports (owner/manager)

Read-only dashboards: sales by zone / server / shift / day; **unpaid checks** with responsible server; **void & comp** totals grouped by reason code; outlier flags (e.g. a server with unusually many comps in a day). Same dark theme; data presented in cards and simple bar lists.

5 Components

Component	Spec
Nav button	48 px square, 14px radius; muted idle, panel-2 bg + blue icon when active.
Server chip	Circular avatar, initials, mint ring; opens server identify / switch.
Zone tab	Rounded card; shows zone name + table-mode caption. Active state uses the blue→purple gradient with dark text.
Category chip	Fully-rounded pill with a colored dot; active gets a blue outline.
Product card	18 px radius; colored left stripe in the category color; name (600) + price (700, category color). Press scales 0.97.
Check header	Ticket number (amber), status tag, zone+table line, optional table input (hidden when mode = none).
Order line	Qty badge · name · state label · line price. State colors: Held amber , Sent mint , Void coral (struck through), Comp purple (struck through). Selected line shows a blue outline.
Line actions	Void (coral, tint bg) and Comp (purple, tint bg) appear only when a chargeable line is selected.
Totals block	Subtotal, Comps (shown negative), and a large Total.
Send button	Full mint , dark text; enabled only when held items exist.
Pay button	Blue→purple gradient, dark text; enabled when chargeable items exist and none are still held.
Reason modal	Centered card; title + one-line explanation; reason buttons from the owner-managed list; Cancel. Used for void and comp.
Toast	Bottom-center pill; 1.5 s; confirms silent actions (“ <i>Mojito added</i> ”, “ <i>2 items sent to kitchen</i> ”).

6 Key Interaction Flows

6.1 Take and send an order

1. Server taps their avatar → identifies by PIN. Title shows the active server and shift.
2. Cashier taps a **zone**. The table field appears unless the zone’s mode is **none**.

3. (Optional) Cashier types/picks the **table number**. The zone+table line updates live.
4. Cashier taps products. Each tap adds a line (or increments quantity); a toast confirms. New lines are **Held** (amber).
5. Cashier taps **Send**. Held lines become **Sent** (mint); status becomes *In progress*.

6.2 Void vs. comp

1. Cashier selects a line → Void / Comp buttons appear.
2. **Void** (before prep): pick a reason; line becomes struck-through coral, removed from totals. **Comp** (after prep): pick a reason; line becomes struck-through purple and is added to the Comps figure.
3. Both actions are logged with server, reason, and timestamp; manager approval is required per the business rules.

6.3 Payment

1. **Pay** is enabled once there are chargeable items and nothing is still Held.
2. On payment the status becomes **Paid**; the check closes and the screen rolls to the next ticket number.
3. A check left open past shift end is surfaced in the unpaid report.

7 States & Feedback

- **Empty check:** centered hint — “*No items yet. Tap a dish to start the check.*”
- **Disabled actions:** Send/Pay dimmed to 35% opacity with a not-allowed cursor; never hidden, so their position is learnable.
- **Silent success:** adds and sends confirm via toast, not modals.
- **Guarded actions:** void, comp, and unpaid-close require a reason and (per rules) manager approval before they take effect.
- **Status tag** on the check is the single source of truth: Open → In progress → Paid (or Unpaid / Voided).

8 Quality Floor (non-negotiable)

- Landscape tablet is the primary target; layout must not break down to a narrow split.
- Minimum 44 px touch targets; element positions stable across states.
- Visible keyboard focus; **prefers-reduced-motion** respected.
- Light mode variant available for daylight (Outside zone): same tokens, inverted surfaces, identical layout.
- All copy in sentence case, active voice; an action keeps its name through its flow (*Send* → “sent”, *Pay* → “paid”).

9 Reference

Visual direction: *CosyPOS — restaurant POS system*, Dmitry Lauretsky for Ronas IT (Dribbble).
Key cues adopted: dark mode; pastel blue/pink/purple accents; per-category color coding for fast menu navigation; rounded card system; three-panel layout (navigation, menu, check).
